

Document Management System (DMS) — Requirement Clarification Questions

Prepared for Client Review | Requirement Gathering Phase

The following questions require confirmation from the client before the system architecture, database schema, workflow logic, and role structure can be finalized for production. This system will be developed as a **Multi-Tenant DMS**, meaning both companies will operate on a single shared application with logically separated data. Please review each item below and provide the requested details or confirm the proposed approach.

1. Company & Tenant Setup (Multi-Tenant Architecture)

How many companies will use this system?

Answer: 2 companies.

- Please provide the names of both companies.

The system will be built as a Multi-Tenant DMS, where both companies share the same application but their data is logically separated. Please confirm the following:

- Should each company's data (documents, users, workflows) be completely isolated from the other, with no cross-visibility?
- Will each company have its own branding (logo, company name) shown after login?
- Should each company be able to configure its own workflow, roles, and notification rules independently (as referenced in later sections)?
- Will a Super Admin role be required at the platform level to manage both tenant companies centrally?

2. Document Upload Notifications

When a user uploads a document, who should receive the notification that a new document has been uploaded?

- Admin
- Manager
- Document reviewer
- Any other designated person?

Should the notification workflow be different for each of the two companies?

3. Login and Authentication

How will users, managers, and administrators log in to the system for both companies?

Proposed Answer: Email ID and password.

Since this is a multi-tenant system, should login be tenant-aware (i.e., the system identifies which company a user belongs to automatically at login), or will each company have a separate login URL / subdomain?

- Should the same email address be allowed to exist under both companies (as separate accounts), or must every email be globally unique across the platform?

4. Concurrent Users

How many concurrent users are expected to use the system for both companies at the same time?

5. Supported Document Types

The system should support the following document types:

- Microsoft Word (.doc, .docx)
- PDF (.pdf)
- Microsoft Excel (.xls, .xlsx)
- Images (.jpg, .jpeg, .png, etc.)

Are there any other document types that need to be supported for either company?

6. Number of Users and Roles

How many users, managers, and administrators will there be for each company?

- Company 1: Number of Users / Managers / Admins
- Company 2: Number of Users / Managers / Admins
- Total number of users who will log in to the system across both companies

7. Document Review and Approval Workflow

When a user uploads a document, it will initially go into Draft / Pending Review status. Please clarify:

- How many reviewers should review the document?
- Should all reviewers approve the document, or is approval from one reviewer sufficient?
- Who will provide the final approval?
- Will the final approver be an Admin, Manager, or another designated authority?
- Should the approval workflow be different for each company?

8. Document Version Control and Revision Workflow

What version-control mechanism is expected for all documents?

Example workflow: Draft → Review 1 → Review 2 → Final Approval → Final

Suppose a user uploads a document and it goes through the following stages:

- Draft
- Review / Approval 1
- Review / Approval 2
- Final Approval
- Final Version

Once the document is finally approved, it becomes the Final Version. If the document needs to be modified later, should the system create a new version rather than overwriting the previously approved version?

Example: Document V1 → Approved Final V1 → Revision Required → Draft V2 → Review → Approval → Final V2

- The previous approved version should remain available in the version history.

9. Document Rejection and Re-upload Process

If an Admin or Manager rejects a document and asks the user to make corrections, what should happen when the user uploads the corrected document?

Proposed workflow: Submitted → Rejected → Correction Required → Re-upload → Pending Review → Approval

Should the corrected document:

- Overwrite the previous file, or
- Create a new version while preserving the old / rejected version?

Recommended: Create a new version and preserve the previous version for audit / history purposes.

10. Document Preview vs. Download

Should the Admin / Manager / Reviewer be required to download the document for review, or should the system provide an in-browser document preview?

Proposed requirement: Enable in-browser preview for both companies, including:

- PDF preview
- Microsoft Word preview
- Excel preview
- Image preview

Should the system also maintain document preview / access tracking, such as:

- Who viewed the document
- Date and time of viewing
- Number of times viewed
- Who downloaded the document
- Date and time of download

This clarification will help finalize the company-wise workflow, role structure, approval process, notification system, version control, and audit requirements before development starts.

Prepared for requirement clarification with the Client / Company Manager.
