

PROJECT SCOPE DOCUMENT

Highly Advanced Corporate Website Integration

Field	Details
Document Type	Project Scope Statement & Technical Proposal
Prepared For	Corporate Customer (Template based)
User Base	Global Public Audience & Internal Content Managers
Platform	Modern Cloud Web Stack
Version	2.0
Status	Draft — For Review

1. Purpose and Objective

This document defines the scope of work for the design, development, and deployment of a highly advanced, SEO-friendly, and scalable corporate website. The website is intended for a corporate customer showcasing their brand portfolio (including FMCG products), company history, and investor relations, based on the provided design templates.

The system is architected around the principles of industrial production-level performance, exceptional visual aesthetics, and high scalability. All content, data, and design assets will be provided by the customer. The platform will serve as the digital face of the brand, optimized for search engines and high user engagement.

2. In-Scope Functional Areas

The following functional modules are included within the scope of this engagement based on the provided website template layout. **Note: All contents, data, text, and media for these sections will be exclusively provided by the customer.**

- **Corporate Identity & History:** Development of "Who We Are", "History", "Brands", and "Leadership" sections to highlight the company's legacy and team (Content provided by

customer).

- **Product Showcase:** A dynamic and visually appealing "Products" module categorizing items (e.g., Snacks, Ice Creams), alongside "Presence" and "Innovation" pages (Content provided by customer).
- **Corporate Relations:** Dedicated areas for "Investors" and a "Newsroom" for press releases and media updates (Content provided by customer).
- **Engagement:** "Career" portal for job listings and a "Contact" page with secure inquiry forms (Content provided by customer).
- **SEO & Performance Optimization:** Implementation of advanced SEO techniques (meta tags, structured data, server-side rendering) and image optimization to ensure lightning-fast load times.
- **Content Integration:** Strict adherence to the customer-provided design and accurate population of all customer-provided content and data.

3. Out-of-Scope Items

The following are explicitly excluded from this phase of work and may be considered in future enhancement phases:

- E-commerce capabilities, shopping carts, or online payment gateways.
- Content creation, copywriting, or graphic design (as these are entirely provided by the customer).
- Complex third-party ERP or CRM backend integrations.
- User forums or interactive community portals.

4. Solution Architecture

The solution follows a modern, decoupled architecture (Jamstack) to ensure high security, maximum scalability, and superior SEO performance.

4.1 Architecture Overview

- End users connect over HTTPS to a highly responsive frontend web application.
- The web application is hosted on a scalable Edge Network / CDN (Content Delivery Network).
- Static assets and high-quality images provided by the customer are stored in optimized cloud storage and served via CDN.

5. Roles and Permissions

For any integrated Content Management System (CMS) provided for future content updates, permissions will be restricted using a simple role model:

Role	Content Update	Media Upload	Site Configuration
Administrator	Yes	Yes	Yes
Content Editor	Yes	Yes	No
Viewer (Public)	No	No	No

6. Data Design (Summary)

If a backend database or headless CMS is utilized for dynamic sections (like Newsroom or Careers), it will include the following core entities:

- **Products:** ProductID, Category, Name, Description, ImageURL
- **NewsItems:** ArticleID, Title, Content, PublishDate, Author
- **JobPostings:** JobID, Title, Department, Location, Description, IsActive
- **ContactInquiries:** InquiryID, Name, Email, Subject, Message, Timestamp

7. Security Requirements

- HTTPS enforced for all traffic and interactions.
- Protection against common web vulnerabilities (XSS, CSRF) at the modern framework level.
- Web Application Firewall (WAF) to prevent DDoS attacks and malicious traffic.
- Secure form endpoints for the Contact and Career sections to prevent spam and data leaks.

8. Technology Stack

Layer	Technology
Frontend	Next.js (React) / Tailwind CSS (for scalable, SEO-friendly UI)
Backend / CMS	Headless CMS or Node.js APIs
Hosting	Vercel / AWS Amplify (Edge Network)
Assets Storage	Cloud CDN (AWS S3 + CloudFront)

9. Estimated Operating Cost

Hosting modern static/server-rendered websites is highly cost-effective and scales automatically with traffic. Final costs will be determined at a later stage.

Component	Estimated Monthly Cost
Frontend Hosting & Edge CDN	
Headless CMS / Database (Basic)	
Asset Storage & Bandwidth	
Estimated Total	

10. Assumptions

- The customer will provide all final content, data, and high-resolution design assets prior to development.
- The design templates provided are final and do not require conceptual alterations.
- Timely feedback will be provided by the customer during User Acceptance Testing (UAT).

11. Future Enhancement Opportunities

The architecture is designed to accommodate the following enhancements in later phases without requiring a complete rebuild:

- Integration of an e-commerce module for direct-to-consumer sales.
- Multi-language support for international markets.
- Advanced interactive 3D product rendering.

12. Rationale / Why This Approach

For a high-end corporate website, this modern architecture provides the perfect balance between functionality and performance:

- **SEO & Performance:** Server-side rendering (SSR) and Edge caching ensure the fastest load times and best search engine rankings, fulfilling the "SEO friendly" requirement.
- **Scalability:** Industrial production-level hosting can handle traffic spikes without downtime.
- **Fidelity:** The technology allows for pixel-perfect implementation of the customer's beautiful design templates.
