

Balaram Mallick Project - Architecture Summary

Project Objective

Build a generic API → SQL Server → Tally Auto Synchronization Engine.

User Flow

Run app.py → Check Tally → Enter Company → Verify Company → Enter SQL Server → Database → Table → API URL → Fetch JSON → Read QR Text → Store in SQL Server → Duplicate Check → Generate XML → Import to Tally → Wait 60 seconds → Repeat.

QR Requirement

Use QR Text (not QR image). API returns QR text in JSON (e.g. SignedQRCode). The engine fetches the JSON automatically.

Customer Inputs

Company Name, SQL Server, Database, Table, API URL.

Automation

API → SQL Server → Tally with automatic synchronization.
