

Document Management System (DMS) — Requirement Clarification Questions

Prepared for discussion with Project Manager | Production Planning Phase

The following questions require clarification from the Project Manager before the system architecture and database schema can be finalized for production. Answers to these items directly impact database design, storage configuration, and workflow logic.

1. Capacity & System Scope

1.1 How many companies will be using this system?

■ *This will determine how the database needs to be structured for data separation (e.g., single shared schema vs. multi-tenant architecture).*

1.2 What is the total expected user count, and exactly how many of them will be Admins?

1.3 How many concurrent users will be updating records at the exact same time?

■ *Important for handling database connection pooling and avoiding data locks.*

2. File Storage Requirements

2.1 What specific document types must we support?

■ *e.g., PDF, Word, Excel, Images — are there any specific image formats or file size limits we need to restrict?*

3. Document Workflow & State Management

3.1 Draft State: After a user uploads a file, does it initially sit in a "Draft" state before they officially submit it for review?

3.2 Review Process: Will the Admin strictly download the file to review it, or do we need to build an in-browser preview feature?

3.3 Rejection & Re-upload Cycle: If the Admin rejects a document for updates, and the user corrects and re-uploads it, does the system simply overwrite the old record and set the status back to "Pending Approval"?

■ *This affects whether we need to script a version control history in the tables, or just update the existing row.*
