

Tally Based Outstanding Report Automation Dashboard

■ Goal

To automate real-time outstanding report generation by fetching data directly from Tally-Prime into Microsoft SQL Server and displaying it through an interactive dashboard with automatic data synchronization.

■ Problem

Businesses using Tally-Prime faced difficulties in generating real-time visual dashboards and outstanding analytics. Manual outstanding report generation from Tally-Prime was time-consuming and error-prone.

- No real-time visibility of pending bills, overdue amounts, and outstanding data.
- Manual outstanding report generation from Tally-Prime was time-consuming and error-prone.
- Data had to be manually exported and re-entered — high chance of human error.
- No interactive dashboard for business performance monitoring.
- When data changed in Tally, reports were not updated automatically.

■ Solution

Built an automated system to fetch Tally data directly into Microsoft SQL Server and developed an interactive dashboard for real-time outstanding tracking and analytics.

- Python script sends XML requests to Tally-Prime and automatically fetches outstanding data.
- Data is stored and structured in Microsoft SQL Server.
- Developed an interactive dashboard for real-time outstanding tracking and analytics.
- Implemented automatic data synchronization — when any data changes in Tally Prime, it is automatically updated in SQL Server and reflected in the dashboard without manual intervention.

■ Success

- Reduced manual reporting effort and improved data accuracy.
- Faster reporting, analysis, and business decision making.
- Real-time dashboard generation — outstanding bills and overdue amounts always up to date.
- Zero manual intervention required after initial setup.

■ User Stories

- As a **Accounts Manager**, I want to view live outstanding bills and overdue amounts so that I can monitor pending payments quickly and take action.
- As a **Business User**, I want to have data automatically sync from Tally Prime to Microsoft SQL Server so that I can avoid manual report preparation entirely.
- As a **Management User**, I want to get an interactive dashboard with charts and filters so that I can analyze business outstanding performance efficiently.
- As a **Accountant**, I want to have the dashboard automatically reflect any changes made in Tally Prime so that the reports are always accurate without manual refresh.

■ Functional Requirements (The Must-Haves)

1. The system must automatically fetch outstanding data from Tally Prime using Python XML requests and store it in Microsoft SQL Server.
2. The dashboard must display real-time outstanding reports, overdue amounts, top parties, and pending bill analytics.
3. The system must automatically refresh and synchronize updated data without manual intervention — when data changes in Tally Prime, it is reflected in the dashboard instantly.

4. Tally Prime company data must be loaded and accessible for Python script querying via XML request on port 9000.
5. Fetch Tally data in structured table format and load it into the SQL Server data model.
6. Create interactive dashboard views for:
 - o Outstanding bill summary — party-wise pending and overdue amounts
 - o Top outstanding parties and pending payment analytics
 - o Data sync status — last updated timestamp and auto-refresh log
 - o Trend analysis — outstanding movement over time

What We Are NOT Doing (Out of Scope)

- No manual Excel-based report generation — fully automated pipeline only.
- No modification of original accounting data inside Tally Prime from the dashboard.
- No mobile application in the current version.
- No AI chat bot or predictive analytics integration in this phase.
- No multi-company cloud deployment — single company, local/on-premise setup.
- No GST portal or payment gateway integration.

Customer Benefits

1. Real-Time Outstanding Visibility

View the Latest outstanding bills, overdue amounts, and pending payments directly from Tally Prime.

2. Automatic Data Synchronization

- Any changes made in Tally Prime are automatically reflected in SQL Server and the dashboard without manual intervention.

3. Eliminates Manual Report Generation

- No need to export data from Tally Prime or prepare reports manually.

4. Faster Business Decision Making

- Managers receive up-to-date financial information for quicker and better decisions.

5. Reduced Operational Costs

- Minimizes manual effort, saving both time and reporting costs.

6. Secure Data Processing

- Data flows directly from Tally Prime to SQL Server through a controlled automated process, reducing the risk of data loss or manipulation.

7. Automatic Refresh

Reports stay up to date without requiring manual refresh or data import.

8. Zero Manual Intervention

- After the initial setup, the system automatically fetches, synchronizes, and displays updated data without user involvement.

9. Better Financial Monitoring

- Enables continuous monitoring of outstanding trends, payment status, and collection performance.

10. Powerful Search and Filtering

- Quickly search and filter parties, ledgers, and outstanding invoices for faster analysis.
